

图书基本信息

书名：<<第四届环境振动国际学术研讨会论文集>>

13位ISBN编号：9787030257659

10位ISBN编号：7030257650

出版时间：2009-10

出版时间：科学出版社

作者：H.Xia , H.Takemiya 编

页数：1630

版权说明：本站所提供下载的PDF图书仅提供预览和简介，请支持正版图书。

内容概要

The environmental vibrations , caused mainly due to train-road traffic , construction activities and factory operations, are being investigated, globally, for their prediction, monitoring, mitigation and evaluation, basically, to improve the quality of life and robust infrastructure in the modern high tech society. The School of Civil Engineering, Beijing Jiaotong University in China is honored to be the organizer of the 4th International Symposium on Environmental Vibrations : Prediction, Monitoring, mitigation and Evaluation (ISEV2009) . This symposium, sequel to the first one held in Hangzhou, China in October 2003, the second one in Okayama, Japan in September 2005, and the third one in Taipei in November 2007, provides an international forum to exchange the knowledge, ideas and experiences for pursuing research on prediction, control and mitigation of environmental vibrations. This series of meetings on environmental vibrations were made possible due to the continuous efforts of four professors : Prof. Yih-Hsing Pao, Honorary Chairman of the symposium, who belongs both to the National Taiwan University and Zhejiang University, Prof. Hirokazu Takeyima of Okayama University, Prof. Yunmin Chen of Zhejiang University, and Prof. Yeong-Bin Yang of the National Taiwan University.

书籍目录

Preface
Volume 1
Wave Propagations
Reverberation-Ray Matrix Analysis of Framed Structures Under Stationary or Moving Load
Wave Propagation in Layered Viscoelastic Media
Relation Between the Ground Vibration and the Geographical Features and Geology Conditions for the Railroad Vibration
A Method on Simulation of Wave Propagation with High Accuracy
A Matlab Toolbox for Seismic Wave Propagation
Theory and Application of Lamb Wave in Arch-dam Structures
The Study of Viscous-Spring Superposition Artificial Boundaries for Multi-sources Scattering Problem
Compress Wave Propagation in a Two Dimensional Domain with Randomly Imperfect Material Density
Volume 2
Environmental Vibrations Induced by Traffic Loads
Free Field Vibrations Due to Traffic and the Operation of a Multi-head Breaker on a Concrete Road
Predictions of High-speed Train Induced Ground Vibration Based on Train-Track-Ground System Model
Investigation of Train-induced Ground Vibrations Using FEM and Field Experiments
A Prediction Model and Experimental Validation of CRH-train Induced Ground Vibrations
Validation of an Inversion Scheme for Source of Ground Vibration near to Urban Railway
Ground Motion Induced by Train Passage in Urban Area
SRM-T: the Dutch Standardized Prediction Model for Railway Vibration and Induced Noise
Analytical Evaluation on Train-induced Ground Vibration Around Shinkansen Viaducts
Decoupling FE Method to Simulate the Environmental Vibration Caused by Urban Rail Traffic
Array Configuration to Observe Vibration from Urban Rail Traffic
Analysis of Ground Vibration Induced by Train Moving Loads
Finite Element Analysis on Ground Vibration Induced by Light-rail Train Running on Viaduct
Numerical Analysis of Ground Vibration Induced by High-speed Maglev Train
Dynamic Response Analysis of Passenger Transport Line to the Surrounding Environment
Vibration Behaviors of the Ground and Houses Couosed by Monorail Traffic.....
Volume Author Index
