

<<Biochemistry-生物化学>>

图书基本信息

书名：<<Biochemistry-生物化学>>

13位ISBN编号：9787040343397

10位ISBN编号：7040343398

出版时间：2012-6

出版时间：丁卫、贾弘禔 高等教育出版社 (2012-06出版)

作者：丁卫，贾弘禔 编

页数：169

版权说明：本站所提供下载的PDF图书仅提供预览和简介，请支持正版图书。

<<Biochemistry-生物化学>>

内容概要

In the past decade , medical education achieved great development in Capital Medical University , China ( CCMU ) , serving the students coming from all parts of China and overseas. On the one hand , the growing number of foreign students at CCMU crave for English books suitable for the teaching and learning with the Chinese medical education system; on the other hand , the Chinese students are asked and eager to actively participate in the international academic exchanges nowadays. To meet the needs of both foreign and Chinese students majoring in basic and clinic medical sciences , CCMU puts forward a project to compile textbooks in English as a part of the university's developing strategy and objectives , which are "based on Beijing , embracing the nation; leading in China and recognized around the world". Thus , the textbook of biochemistry in English was prepared by the senior instructors in the Department of Biochemistry and Molecular Biology , CCMU.

## 书籍目录

Chapter1 Molecular Compositions of Proteins 1.1 Molecular Compositions of Proteins 1.2 Protein Structure 1.3 Protein Structure and Function 1.4 Protein Physicochemical Properties 1.5 Classification of Proteins Chapter2 Nucleic Acids 2.1 Nucleotides and Nucleic Acids 2.2 Spatial Structure and Function of DNA 2.3 Spatial Structure and Function of RNA 2.4 Physicochemical Properties of Nucleic Acids Chapter3 Enzymes 3.1 Structures and Properties of Enzymes 3.2 Enzymatic Kinetics 3.3 Regulation of Enzymes 3.4 Medical Aspects of Enzymes Chapter4 Metabolism of Carbohydrates 4.1 Overview 4.2 Glycolysis and Anaerobic Oxidation of Glucose 4.3 Aerobic Oxidation of Glucose 4.4 Pentose Phosphate Pathway 4.5 Gluconeogenesis 4.6 Glycogen Catabolism Chapter5 Lipid Metabolism 5.1 Overview 5.2 Triglyceride Metabolism 5.3 Phospholipid Metabolism 5.4 Cholesterol Metabolism 5.5 Lipid Transportation in Plasma Chapter6 Biological Oxidation 6.1 Electron Carriers and Electron Transport Chain 6.2 Oxidative Phosphorylation 6.3 Shuttle Systems 6.4 Mitochondrial Diseases Chapter7 Amino Acid Metabolism 7.1 Requirement of Protein/Amino Acids 7.2 Protein Digestion, Absorption and Putrefaction 7.3 Amino Acid Metabolic Pool 7.4 General Pathways of Amino Acid Catabolism 7.5 Metabolism of Individual Amino Acids Chapter8 Metabolism of Nucleotides 8.1 Metabolism of Purine Nucleotides 8.2 Metabolism of Pyrimidine Nucleotides 8.3 Conversion of Nucleotides 8.4 Nucleotide Metabolism Related to Medicine Chapter9 Regulation and Integration of Metabolism 9.1 Characteristics of Metabolism 9.2 Interconversion of Metabolic Pathways 9.3 Regulation of Metabolisms Chapter10 DNA Biosynthesis 10.1 DNA-dependent DNA Synthesis(Replication) 10.2 RNA-dependent DNA Synthesis(Reverse Transcription) 10.3 DNA Damage and Repair Chapter11 RNA Biosynthesis 11.1 RNA Biosynthesis(Transcription) 11.2 RNA Post-transcriptional Processing Chapter12 Protein Biosynthesis, Sorting and Targeting 12.1 Protein Synthesis System 12.2 Protein Synthesis in Prokaryotes 12.3 Protein Synthesis in Eukaryotes 12.4 Protein Sorting and Targeting 12.5 Clinical Relevancies of Protein Synthesis Chapter13 Biochemistry of Blood 13.1 Composition and Functions of the Blood 13.2 Plasma Proteins 13.3 Blood Cell Metabolism Chapter14 Biochemistry of the Liver 14.1 Metabolic Roles of the Liver 14.2 Biotransformation in the Liver 14.3 Metabolism of Bile Acids 14.4 Bile Pigment Metabolism

## 章节摘录

版权页：插图：1.4.2 Protein Solution Behaves Colloid Property Proteins are polymers with molecular weights generally in 10-1,000KD. According to the measurement knowledge, for example, a globular protein with molecular weight of 34.5KD, the particle diameter is 4.3nm. Therefore, the particle diameter of protein molecules are generally in 1-100nm, forming a colloidal solution in water, with a Tyndall phenomenon, Brownian motion. not through a semipermeable membrane, slower diffusion, greater viscosity etc. Proteins contain many hydrophilic groups such as amino, carboxyl, hydroxyl, thiol and amide group on the surface, which form a hydration shell with water molecules to separate the particles of protein molecules with each other. In addition, proteins carrying the same type of charges make electric repulsion. Hydration shell and electric repulsion make proteins stable in solution. 1.4.3 Proteins may Undergo Denaturation and Renaturation The process in which a protein loses its native conformation under the treatment of denaturants is called protein denaturation. The denaturants include physical factors such as heat, ultraviolet light, violent shaking, and chemical factors such as strong acids, bases, organic solvents and detergents. A loss of three dimensional structure is sufficient to cause change of physical and chemical properties and biological characteristics of proteins, loss of function, but does not affect the primary structure of proteins. Denaturation is essentially the breakage of noncovalent bond (hydrogen bond, ionic bond, hydrophobic interactions, etc.). The denatured proteins tend to decrease in solubility, increase the viscosity, and lose the biological activity. Denaturation of some proteins is reversible.
