章节摘录

Of all business professionals , the financial trader is the closest to being purely event-driven. The trading floor is one of the most information-intensive environments in the world , and it was for the trader that we first developed real-time infrastructure software. The complex , integrated , value-added market information dancing across the video screen of the trader your broker looks to for instant order execution arrives at the trader's station via publish/subscribe technology. Your trader learns about every flicker in stock and bond prices as they're happening , and what those flickers mean. His or her Lightning-quick event-driven reaction to change is an excellent example of how instant information drives instant innovation. In fact , if the event-driven infrastructure can be said to have a single transformational goal for your company , it is to give every single employee the tools to become more trader-like-hyper-aware , entrepreneurial , fully informed about every shift and trend in the competitive environment. Several times I've mentioned "value-added information." In the event-driven infrastructure's earlier days , in the 1980s , we sought to create extra customer value by augmenting the simple reporting of fluctuations in stock prices by feeding those price change reports into application programs that used them to create wide-ranging analyses or automated trading decisions. These higher functions in turn created new data , which we instantaneously fed back into the network for other traders to use.
