## 章节摘录

Inventory refers to the stock of goods that are maintained for a variety of purposes , such as for resale to others , as well as to support manufacturing or assembling processes. 1 Inventory is the key issue to supply chain management success. Customers demand that their orders be shipped completely , accurately and on time , which means having the right inventory at the right place and right time. 2

**Inventory Classifications** It is important to know the key classifications of inventory because the classification influences the way of inventory management. Inventory is mainly classified into cycle stock , safety inventory , in-transit inventory and dead inventory.

**Cycle Stock** Cycle stock refers to inventory that is needed to satisfy normal demand during the course of an order cycle ( See Figure 3-2 ) . If demand and lead time are constant , only cycle stock is necessary.

**Safety Inventory** Safety inventory refers to inventory that is held in addition to cycle stock to guard against uncertainty in demand and lead time ( See Figure 3-2 ) . Generally , the higher the safety inventory , the better a firm's customer service. It is because the firm suffers fewer "stockouts". 3
